

Search Tree in Prolog

Samy Aittahar

ULiege - INFO0049

Tuesday 20th February, 2018

Me in a nutshell

- ▶ PhD Student in computer science.
- ▶ Main research : Transfer learning for deep reinforcement learning.
- ▶ Personal page :
<http://www.montefiore.ulg.ac.be/~saittaha/>.
- ▶ Contact me at saittaha@ulg.ac.be or come to my office (I-136).

Key urls

- ▶ Sessions repository :
`https://github.com/epochstamp/INF00049-1`
- ▶ Submission platform : `https://submit.montefiore.ulg.ac.be/teacher/viewprojects/INF00049-1`

Outline

- ▶ Today : Presentation of search tree in Prolog + exercises (no expected deliverable).
- ▶ Later : Presentation of (up to 6) projects with expected deliverable.
 - ▶ Only source code with clear documentation is needed.
 - ▶ The timeframe for each project is one month, according to deadline displayed in the submission platform.
 - ▶ After the deadline, you are expected to present your work to the class. The teacher may be present.

Facts and search trees

- ▶ A fact is a logical statement, represented by a first-order logical predicate ;
- ▶ Depth-first searching algorithm through a given database of facts and predicates;
 - ▶ Goes backward when either unification fails or succeed ;
- ▶ Pro : enumerates all possible solutions ;
- ▶ `/!\` Even if logically equivalent, order of facts often matters for computational efficiency !

Example 1 - Facts

$m(am, b).$

$m(am, s).$

$m(am, f).$

$m(an, c).$

$f(c, b).$

$f(c, s).$

$f(n, f).$

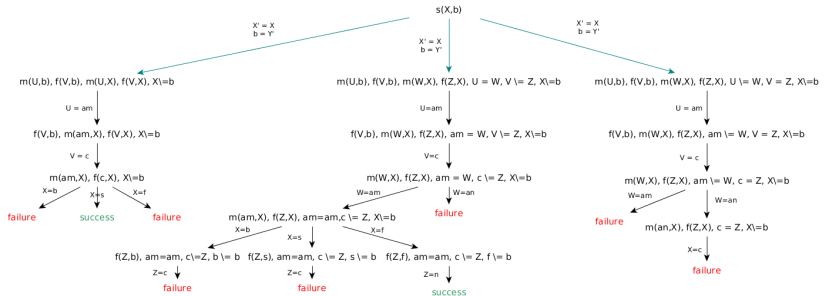

$f(e, c).$

$s(X, Y) :- m(U, Y), f(V, Y), m(U, X), f(V, X), X \neq Y.$

$s(X, Y) :- m(U, Y), f(V, Y), m(W, X), f(Z, X), U = W,$
 $V \neq Z, X \neq Y.$

$s(X, Y) :- m(U, Y), f(V, Y), m(W, X), f(Z, X), U \neq W,$
 $V = Z, X \neq Y.$

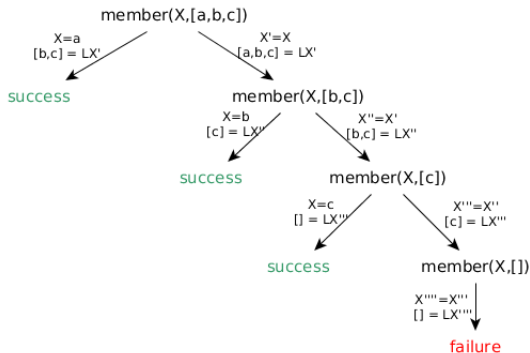

Search Tree for Example 1

Example 2 - Lists

```
member(X,[X|_]).  
member(X,[_|LX]) :- member(X,LX).
```

Search Tree for Example 2

Example 3 - Accumulator list

```
reverse(L,R) :- reverse(L,[],R).
```

```
reverse([],R,R).
```

```
reverse([X|L],R2,R) :- reverse(L,[X|R2],R).
```

Search Tree for Example 3

reverse([a,b,c],R)
[a,b,c] = L
R' = R
↓
reverse([a,b,c],[],R)
a = X
[b,c] = L'
R2 = []
↓
reverse([b,c],[a],R)
b = X'
[c] = L''
R2 = [a]
↓
reverse([c],[b,a],R)
c = X''
[] = L'''
R2 = [b,a]
↓
reverse([], [c,b,a], R)
R = [c,b,a]
[] = L''''
↓
success

Search Tree for Example 3 (bis)

`reverse(L,[a,b,c]).`

???

Training time !
